EXECUTIVE ASSESSMENT

We tested 65,929 journal lines for the period ending 2024-12-31; 21,094 documents flagged by ten risk rules were ranked into a 40-item review universe. The reviewer directed 35 item(s) for substantive inspection and accepted 5 as adequately supported. The model rated 1 item(s) high-concern; each received a human decision. Currency coverage gaps restricted ranking to the base currency; the excluded populations are documented (Section 3) and constitute a scope limitation requiring acknowledgment. 3 document(s) failed the balance check (debits ≠ credits) — impossible without error or manipulation; each is individually decided below.

FINDINGS & OBSERVATIONS

Risk-rated, 5C structure (criteria · condition · cause · consequence · corrective action). Highest risk first.

HIGH Journal documents that do not balance	
CRITERIA	Every journal document must net to zero across its lines (double-entry principle).
CONDITION	3 document(s) in the population fail the balance check within tolerance.
CAUSE	Possible causes include extract truncation, manual keying error, or deliberate manipulation of line amounts.
CONSEQUENCE	Unbalanced postings indicate a breakdown of the fundamental control that makes journal analysis reliable; if present in the ledger they misstate account balances directly.
CORRECTIVE ACTION	Vouch each listed document to its source and ledger image; if the ledger agrees, escalate as a potential override of controls and consider fraud-response obligations (ISA 240 §32).

MEDIUM Manual-entry concentration by flagged user H.AITLA	
CRITERIA	High-risk users (per engagement risk assessment) should generate few manual entries, each independently supported.
CONDITION	20 of 40 reviewed documents were posted manually by H.AITLA, including period-end asset acquisitions routed through an account pair absent from the system baseline.
CAUSE	Asset acquisitions posted manually outside the standard procurement workflow suggest either an approval bypass or an unconfigured automated interface.
CONSEQUENCE	Concentration of manual authority in one flagged user over large, just-below-threshold acquisitions weakens segregation of duties and raises structuring risk.
CORRECTIVE ACTION	Enquire on capex approval workflow; re-assign posting rights; require dual authorization above a defined threshold; perform collective evaluation of the series.

LOW First-digit distribution deviates from Benford expectation	
CRITERIA	Benford's Law is an informational analytical (amendment C2); journal populations are not naturally Benford-distributed.
CONDITION	MAD 0.0158 — nonconformity on Nigrini bands.
CAUSE	Round-amount conventions (MAD bookkeeping, 10k multiples), threshold clustering, or genuine digit-pattern anomalies.
CONSEQUENCE	None by itself; deviation informs where to point inquiry, never concludes fraud.
CORRECTIVE ACTION	Use the digit-level chart (Section 2) to target inquiry; correlate spikes with round-amount and splitting rules.

1 • DETERMINISTIC RULE RESULTS

Ten rules executed in canonical order on the frozen extract. Recall-first design: every hit enters cross-reference ranking; precision is restored by human review. Expand a rule for its distribution and top hits.

RULE	WHAT IT DETECTS	FLAGS	% OF POP.	OUTCOME
Manual entries flags_manual_entries	Lines posted manually (mapped type or derived human username) — the primary journal-entry fraud vehicle.	56,012	85.0%	ranked
Period-end proximity flags_period_end	Manual entries within the configured pre/post-close window around period end, including post-close postings.	1,184	1.8%	review driver
Round amounts flags_round_amounts	Large amounts divisible by the round-number multiple above the materiality floor.	52	0.1%	review driver
Date divergence flags_date_divergence	Document date vs posting date gaps and entries created after period end but posted in-period (backdating signal).	16	0.0%	review driver

Entry splitting flags_entry_splitting	Clusters of manual lines just below the split threshold to one account within a short window (salami tactics).	920	1.4%	review driver
Balance check flags_balance_check	Documents whose debit/credit lines fail to net to zero within tolerance — impossible without error or manipulation.	3	0.0%	review driver
Unusual users flags_unusual_users	Rare manual users and users on the configured high-risk list.	22,325	33.9%	ranked
Unusual account pairs flags_unusual_pairs	Debit/credit account pairs absent from the system-entry baseline (a document never baselines itself).	22,632	34.3%	ranked
Reversals flags_reversals	Near-exact negations of in-period entries shortly after period end (profit-and-loss fix pattern).	0	0.0%	clean
High-risk system pairs flags_high_risk_system_pairs	Informational screen — system documents by high-risk users on accounts unusual for that user. Never gates.	0	0.0%	clean

2 · BENFORD FIRST-DIGIT CONFORMITY

Informational analytical (amendment C2): observed leading-digit distribution of all absolute amounts ≥ 1 against the Benford expectation, with 95% confidence whiskers on each observation. Informs inquiry — never gates.

MEAN ABSOLUTE DEVIATION

0.0158

Nigrini bands: **nonconformity**

Read: bars are the observed share of amounts starting with each digit; amber diamonds join the Benford curve $\log_{10}(1+1/d)$; whiskers are 95% confidence intervals. Whiskers crossing the diamonds are consistent with expectation.

Population analysed: **65,929** amounts. Journal populations are not naturally Benford-distributed (C2); deviations inform inquiry and never conclude fraud.

3 · REVIEW-UNIVERSE SELECTION

Workload control W1 with currency-stratified fallback X2/Y8; exclusions are limitations requiring acceptance (gate 4).

6 · WORKPAPER NARRATIVE

Drafted by the model strictly from the keyed facts block; citations resolved inline (gate 3 validates every reference).

Scope and Approach

For audit run SAPFULL_2024 covering the period ending **2024-12-31**, we tested a population of **65929** journal lines. A total of **21094** documents met initial flagging criteria from **21094** total flagged items before capping. The review universe was established at **40** items using **currency-stratified fallback**.

Flagging Results

Risk rules generated the following hit distributions across the dataset: **56012** manual entries, **22632** unusual pairs, **22325** unusual users, **1184** period-end items, **920** entry splitting instances, **16** date divergence instances, **52** round amounts, **3** balance check failures, **0** reversals, and **0** high-risk system pairs.

Findings and Observations

Testing identified 3 balance check failures (**3**), indicating instances where debits do not equal credits within tolerance. Additionally, manual-entry concentration by high-risk user H.AITLA and first-digit Benford distribution deviations were observed across the flagged population.

Review Outcomes

Out of the reviewed items, the reviewer directed **35** items for substantive inspection and accepted **5** items as adequately supported, with **0** override decisions recorded.

Limitations and Follow-ups

Currency coverage gaps restricted ranking to the base currency for run ID **40**, representing a scope limitation that requires appropriate acknowledgment and follow-up procedures in subsequent audit phases.

Mandatory limitations (§11)

- 1. Vouching is external: entries marked 'inspect' leave this tool for substantive testing against supporting documentation; this workpaper lists them, it does not vouch them.
- 2. Benford analysis is informational: journal amount populations are not naturally Benford-distributed; results inform inquiry, never conclude.
- 3. System-entry account pairs are not screened: unusual_pairs defines its baseline from system entries of the current period, excluding previously flagged documents.
- 4. Reviewer identity is declared, not authenticated, until SSO (reviewer_source distinguishes); decision rows are hash-chained so tampering is detectable, but identity is not yet non-repudiable.
- 5. Statistical outlier results are seeded and recorded; seeds live in the run store.
- 6. LLM outputs are documented, not deterministic — the reproducibility guarantee covers the deterministic path; the judgment path is fully logged instead.
- 7. Triage follow-ups are recorded, not executed — acting on one is a deliberate new run.
- 8. The representative sample supports targeted coverage, not statistical projection.
- 9. LLM-facing free text is sanitized, not guaranteed safe: descriptions are delimited untrusted data and scanned for injection patterns; prompt-level defense is a mitigation, and the structural backstop is schema-constrained advisory output behind human review.
- 10. PII scrubbing is pattern-based: regex classes and configured redaction terms remove structured identifiers from LLM-bound text but cannot catch all sensitive prose.

Scope & use. This tool is a risk-flagging, prioritization, documentation and review-workflow system. It is not a substitute for substantive testing or vouching, not a complete fraud detection system, and provides no assurance that no material misstatement exists. Entries marked “inspect” leave this tool for substantive testing against supporting documentation; this report lists them — it does not vouch them. LLM outputs are documented, not deterministic; the deterministic path is reproducible and the judgment path fully logged and tamper-evident.
