EXECUTIVE ASSESSMENT

We tested 65,929 journal lines for the period ending 2026-06-30; 21,314 documents flagged by ten risk rules were ranked into a 40-item review universe. The reviewer directed 40 item(s) for substantive inspection. Currency coverage gaps restricted ranking to the base currency; the excluded populations are documented (Section 3) and constitute a scope limitation requiring acknowledgment. 3 document(s) failed the balance check (debits ≠ credits) — impossible without error or manipulation; each is individually decided below.

FINDINGS & OBSERVATIONS

Risk-rated, 5C structure (criteria · condition · cause · consequence · corrective action). Highest risk first.

HIGH Journal documents that do not balance	
CRITERIA	Every journal document must net to zero across its lines (double-entry principle).
CONDITION	3 document(s) in the population fail the balance check within tolerance.
CAUSE	Possible causes include extract truncation, manual keying error, or deliberate manipulation of line amounts.
CONSEQUENCE	Unbalanced postings indicate a breakdown of the fundamental control that makes journal analysis reliable; if present in the ledger they misstate account balances directly.
CORRECTIVE ACTION	Vouch each listed document to its source and ledger image; if the ledger agrees, escalate as a potential override of controls and consider fraud-response obligations (ISA 240 §32).

LOW First-digit distribution deviates from Benford expectation	
CRITERIA	Benford's Law is an informational analytical (amendment C2); journal populations are not naturally Benford-distributed.
CONDITION	MAD 0.0158 — nonconformity on Nigrini bands.
CAUSE	Round-amount conventions (MAD bookkeeping, 10k multiples), threshold clustering, or genuine digit-pattern anomalies.
CONSEQUENCE	None by itself; deviation informs where to point inquiry, never concludes fraud.
CORRECTIVE ACTION	Use the digit-level chart (Section 2) to target inquiry; correlate spikes with round-amount and splitting rules.

1 • DETERMINISTIC RULE RESULTS

Ten rules executed in canonical order on the frozen extract. Recall-first design: every hit enters cross-reference ranking; precision is restored by human review. Expand a rule for its distribution and top hits.

RULE	WHAT IT DETECTS	FLAGS	% OF POP.	OUTCOME
Manual entries flags_manual_entries	Lines posted manually (mapped type or derived human username) — the primary journal-entry fraud vehicle.	56,012	85.0%	ranked
Period-end proximity flags_period_end	Manual entries within the configured pre/post-close window around period end, including post-close postings.	0	0.0%	clean
Round amounts flags_round_amounts	Large amounts divisible by the round-number multiple above the materiality floor.	2,221	3.4%	review driver
Date divergence flags_date_divergence	Document date vs posting date gaps and entries created after period end but posted in-period (backdating signal).	14	0.0%	review driver
Entry splitting flags_entry_splitting	Clusters of manual lines just below the split threshold to one account within a short window (salami tactics).	920	1.4%	review driver
Balance check flags_balance_check	Documents whose debit/credit lines fail to net to zero within tolerance — impossible without error or manipulation.	3	0.0%	review driver
Unusual users flags_unusual_users	Rare manual users and users on the configured high-risk list.	0	0.0%	clean
Unusual account pairs flags_unusual_pairs	Debit/credit account pairs absent from the system-entry baseline (a document never baselines itself).	23,519	35.7%	ranked
Reversals flags_reversals	Near-exact negations of in-period entries shortly after period end (profit-and-loss fix pattern).	0	0.0%	clean

High-risk system pairs
flags_high_risk_system_pairs

Informational screen — system documents by high-risk users on accounts unusual for that user. Never gates.

2 · BENFORD FIRST-DIGIT CONFORMITY

Informational analytical (amendment C2): observed leading-digit distribution of all absolute amounts ≥ 1 against the Benford expectation, with 95% confidence whiskers on each observation. Informs inquiry — never gates.

MEAN ABSOLUTE DEVIATION

0.0158

Nigrini bands: **nonconformity**

Read: bars are the observed share of amounts starting with each digit; amber diamonds join the Benford curve $\log_{10}(1 + 1/d)$; whiskers are 95% confidence intervals. Whiskers crossing the diamonds are consistent with expectation.

Population analysed: **65,929** amounts. Journal populations are not naturally Benford-distributed (C2); deviations inform inquiry and never conclude fraud.

3 · REVIEW-UNIVERSE SELECTION

Workload control W1 with currency-stratified fallback X2/Y8; exclusions are limitations requiring acceptance (gate 4).

6 · WORKPAPER NARRATIVE

Drafted by the model strictly from the keyed facts block; citations resolved inline (gate 3 validates every reference).

Scope and Approach

The journal entry testing engagement for run **DEMO_2026** covered the period ending **2026-06-30**. A total of **65929** population lines were ingested and subjected to automated risk rules. From this population, **21314** documents were flagged before capping **21314**, resulting in a final review universe of **40** items selected via **currency-stratified fallback**.

Flagging Results

The application of ten risk rules across the population yielded the following results: **56012** manual entries, **23519** unusual account pairs, **2221** round amounts, **920** entry splitting instances, **14** date divergences, **3** balance check failures, **0** high-risk system pairs, **0** period-end entries, **0** reversals, and **0** unusual users.

Findings and Observations

Testing identified specific high and low risk conditions. Under **3**, 3 documents failed the balance check where debits do not equal credits. Additionally, first-digit distributions showed nonconformity

on Nigrini bands with a MAD of 0.0158, correlating with round-amount and splitting rules.

Review Outcomes

During the review of the 40 items in the universe, the reviewer directed 40 items for substantive inspection, while 0 items were accepted without further testing and 0 items were subjected to override decisions.

Limitations and Follow-ups

Currency coverage gaps restricted ranking strictly to the base currency for run DEMO_2026 (period end 2026-06-30). Excluded populations represent a scope limitation that must be acknowledged, and the 3 unbalanced documents require vouching to source documents and ledger images per ISA 240.

7 · LIMITATIONS & GOVERNANCE

Mandatory limitations (\$11)

- 1. Vouching is external: entries marked 'inspect' leave this tool for substantive testing against supporting documentation; this workpaper lists them, it does not vouch them.
- 2. Benford analysis is informational: journal amount populations are not naturally Benford-distributed; results inform inquiry, never conclude.
- 3. System-entry account pairs are not screened: unusual_pairs defines its baseline from system entries of the current period, excluding previously flagged documents.
- 4. Reviewer identity is declared, not authenticated, until SSO (reviewer_source distinguishes); decision rows are hash-chained so tampering is detectable, but identity is not yet non-repudiable.
- 5. Statistical outlier results are seeded and recorded; seeds live in the run store.
- 6. LLM outputs are documented, not deterministic — the reproducibility guarantee covers the deterministic path; the judgment path is fully logged instead.
- 7. Triage follow-ups are recorded, not executed — acting on one is a deliberate new run.
- 8. The representative sample supports targeted coverage, not statistical projection.
- 9. LLM-facing free text is sanitized, not guaranteed safe: descriptions are delimited untrusted data and scanned for injection patterns; prompt-level defense is a mitigation, and the structural backstop is schema-constrained advisory output behind human review.
- 10. PII scrubbing is pattern-based: regex classes and configured redaction terms remove structured identifiers from LLM-bound text but cannot catch all sensitive prose.

Scope & use. This tool is a risk-flagging, prioritization, documentation and review-workflow system. It is not a substitute for substantive testing or vouching, not a complete fraud detection system, and provides no assurance that no material misstatement exists. Entries marked "inspect" leave this tool for substantive testing against supporting documentation; this report lists them — it does not vouch them. LLM outputs are documented, not deterministic; the deterministic path is reproducible and the judgment path fully logged and tamper-evident.
